

edcms

The flexible, powerful, web-enabled central management system for networks of retail outlets.

edcms

from **Eurodata International** is a modular ASP application enabling central management of items, suppliers and personnel for any network of retail outlets.

Part of our **edhos** head office solution, **edcms** has two core modules covering admin and operations, and supply chain management, together with several add-ons. It is available by subscription giving greater visibility and tighter control of cost.

edcms is international, multilingual and highly configurable, enabling perfect alignment of the solution with your business processes. It has the flexibility to support both centralised and de-centralised business models including intelligent management of local suppliers and products.

From over 40 years of listening to our retail customers, **edcms** is reliable, easy to use, fully functional and perfectly aligned to retail needs in all sizes of network.

Designed and supported by one of Europe's leading retail software specialists, **edcms** allows you to control your network without letting the software control you.

Flexible. With **edcms** you buy only what you need when you need it. There are extensive set up options and an unbeatable site selection tool that can select single and multiple sites across unlimited site characteristics.

It can support both centralised and de-centralised models in networks of any scale and complexity with optional remote mini-back-office functions for small sites. **Flexible it is.**

Powerful. As part of the much bigger **edhos** head office system, **edcms** has the power to support the very biggest international retail networks. It is capable of managing highly complex item and supplier databases including local suppliers and products.

It has advanced selling and purchase price management tools, and a valuable intuitive alert management system which monitors the network by exception against preset thresholds.

Cost efficient. Because **edcms** is so easy to use and delivered over the web, you can save money on server and database management costs. ASP operating costs are predictable and modular subscription purchase optimises expenditure.

Module 1.

Basic file administration

manages items, suppliers and staff. Sales items are managed by type, such as single, compound, weight/price, menu and fixed rate. Suppliers can be managed by rank (primary, secondary ...) and price levels, and both items and suppliers can be managed at local level by individual outlet.

System administration

defines the retail organisation and manages the set up of sites on the system, including definition of unlimited site characteristics.

It defines item database hierarchy, supplier settings, profiles and users, VAT, payment modes, due dates and ledger account plans. Importantly, it sets thresholds for the various monitoring alerts.

Operational management

manages item price and promotions including extremely sophisticated future pricing and advanced selling and purchase pricing. It also manages alerts and warnings, remote data capture, remote site management and the interface with accounting.

Module 2.

Supply chain management

controls item orders and deliveries and manages supplier invoices and payments. This is a powerful tool capable of central and local management of orders, deliveries and invoices, including sophisticated grouping and matching possibilities.

Add-ons. One of several add-ons offered, **Back-office Lite** provides a direct POS link for item management and other core functions such as pre-accounting, daily reporting and invoice entry.

Well supported. We quickly tackle any difficulties through our highly efficient telephone assistance service which is tailored to meet individual customer needs.
